

Streak Plate Method

Designing Life with AI

July 14, 2026

Description

Streaking bacteria is a method used to isolate single colonies from a glycerol stock on an agar plate, which can then be used to start a liquid culture from a single colony.

Steps

1. Take glycerol stock of the wanted bacteria from -70 °C fridge.
2. Under highly sterile conditions, scratch with a tip or a loop the frozen bacteria colonies.
3. Streak the bacteria with a sterile loop, as shown in the figure above, to dilute the culture and obtain single colonies.
